## JOEP TRUIJEN

"As a designer, I try to find a place in a new, not yet existing or known position in the design or art domain. A place where the relationship between man and machine is central, hardware and software are brought together in new ways and leads to experiences from now and possibly from the future "

As a designer I deal with fast growing technologies such as artificial intelligence, machine learning, image processing, virtual reality and augmented reality, where I like to position myself between the developers and the user of these. I see that there is a considerable gap between the two parties and I try to use my research and designs to explain different layers and points of attention in order to contribute to the user's awareness of these technologies. For example, to prevent abuse, to remove fear of the unknown, to provide information, etc. I therefore see my projects more as part of a larger research in which I try to define and visualize the relationship between people and new technology.
